

**AMENDMENTS TO THE CLAIMS**

Please amend the claims as follows.

1. (Currently Amended) A device to load commands of a service (S) in a computer system including a server and at least one integrated circuit card (CARD) connected together via a network, said at least one integrated circuit card including a first command execution program (P1) and a first memory (M1), wherein,  
said at least one integrated circuit card (CARD) includes:

~~means to search for a sequence block (B) capable of searching on said server or in said first memory (M1) a command sequence block specific to a service, for at least one command (CD) of said sequence block (B) being executed by said first command execution program (P1) or transmitted to a subscriber unit (SU) and executed by a second execution program (P2) of said subscriber unit (SU);~~

said first command execution program (P1) controls the integrated circuit of the card into performing commands which are stored in a memory of the card, and, after executing a command, identifying the next command to be executed by means of link data stored in the memory of the card; and

means to search for the next command as identified by the link data in the first memory of the card and, if the next command as identified by the link data is not to be found in the first memory of the card, to search on said server for a command sequence block including said next command;

and said server includes:

means (ML) for loading said integrated circuit card with only a part of a sequence of commands of said service, said part of said sequence of commands of said service comprising at least one said command sequence block (B) ~~of commands of said~~

service (S), wherein upon completion of loading, only said part of said sequence is loaded.

2. (Previously Presented) The device according to claim 1, wherein said first memory (M1) is non volatile.
3. (Previously Presented) The device according to claims 1 or 2, wherein said integrated circuit card includes a second non volatile memory (M2) including data specific to at least one service.
4. (Currently Amended) The device according to claim 1, wherein said server includes means to back up (MSSEQ1,MSSEQ2) at least one sequence block (B) in said first memory (M1)[[,]].
5. (Previously Presented) The device according to claim 1, wherein said server includes update means (MU) capable of modifying, erasing, and adding, in said first memory (M1), at least one sequence block (B).
6. (Previously Presented) The device according to claim 1, wherein said first memory (M1) includes a first area (Z1) and a second area (Z2), said first area (Z1) having read and write access by said server and read access by said integrated circuit card, said second area (Z2) having read and write access by said integrated circuit card.
7. (Previously Presented) The device according to claim 1, wherein said integrated circuit card (CARD) includes data request means (RD), wherein data is sent by a service server.
8. (Previously Presented) The device according to claim 1, wherein said integrated circuit card includes means of interpreting (MI) command sequence blocks.
